How it works

The BWS UltraFilter (UF) System is a point-of-entry, whole house filter where miles of hollow fiber tubes are bundled together and encapsulated inside an 8" diameter composite pressure vessel. The UF vessel is coupled with the BWS Voda control valve for backwashing. The addition of a timer controlled bottom flush valve creates, a complete, automatically controlled system requiring very little homeowner intervention.

UF is a filtration process whereby solids and high molecular weight organic molecules are removed from water as it passes through the semipermeable UF membrane. Tiny pores in the membrane allow the water and any dissolved minerals to pass through the membrane, while any solids and organic compounds larger than the membrane's molecular weight cut off, are rejected. The result is treated water with recued levels of bacteria, viruses, and cysts, that is also virtually free of colloids, sediment, tannins, turbidity, and other particles >0.02 µm.
